## **CBGL:** Fast Monte Carlo Passive Global Localisation of 2D LIDAR Sensor

School of Electrical and Computer Engineering Aristotle University of Thessaloniki, Greece

## Setup & Motivation

and estimate

 $\hat{\boldsymbol{p}}(\hat{x},\hat{y},\hat{\theta}).~\boldsymbol{p}-\hat{\boldsymbol{p}}=(\Delta\hat{\boldsymbol{l}},\Delta\hat{\theta})$ 

Ray (CAER) metric

 $p(x, y, \theta)$ 

**Definition 1.** The Cumulative Absolute Error per

 $S_V(\hat{p})$  scans, in the local co-

ordinate frame of each sensor

$$\operatorname{CAER}(\mathcal{S}_{R}, \mathcal{S}_{V}) \triangleq \sum_{n=0} \left| \mathcal{S}_{R}[n] - \mathcal{S}_{V}[n] \right| (1)$$

$$\stackrel{\Xi}{\underset{V}{\text{H}}} 1200$$

$$\stackrel{\Xi}{\underset{V}{\text{H}}} 300$$

$$O_{rientation} \circ 0.0 + \pi \circ 0.0 \quad 10.0 \quad 20.0 \quad 30.0$$

$$O_{rientation} \circ 0.0 \circ 10.0 \quad 20.0 \quad 30.0$$

$$O_{rientation} \circ 0.0 \circ 10.0 \quad 20.0 \quad 30.0$$

$$O_{rientation} \circ 0.0 \circ 10.0 \quad 20.0 \quad 30.0$$

$$O_{rientation} \circ 0.0 \circ 10.0 \quad 20.0 \quad 30.0$$

## The gist

The method estimates the pose of a 2D LIDAR given only a single measurement and the map of the environment, while

- being robust against
  - -environment repetitions
- -map distortions
- -sensor noise

2.0

- -sensor FOV (radial & angular)
- executing at  $\approx 1$  sec per 100 m<sup>2</sup> of environ-
- requiring no parameters to be tuned
- making no assumptions about the environment

because CAER (eq. (1))

- scales with position and orientation error
- computationally cheap O(sensor rays)

## Experiments with real and synthetic data

| $\begin{array}{l} {\rm In} > 6000 \\ {\rm attempts} \end{array}$ | Mean      | Mean        | Mean        |
|--|-----------|-------------|-------------|
|  | Position  | Orientation | Execution   |
|  | Error [m] | Error [rad] | Time [sec]  |
| ALS [1]  | 0.500     | 1.956       | 6.15        |
| CBGL   | 0.041     | 0.011       | <b>1.61</b> |
